2020 session

25 July 2019–22 July 2020

Agenda items 5 (a) and 6

High-level segment: ministerial meeting of the high-level political forum on sustainable development, convened under the auspices of the Economic and Social Council

High-level political forum on sustainable development, convened under the auspices of the Economic and Social Council

Progress towards the Sustainable Development Goals

Report of the Secretary-General

Summary

In accordance with General Assembly resolution [70/1](#), the Secretary-General, in cooperation with the United Nations system, has the honour to transmit the 2020 report on progress towards the Sustainable Development Goals. The present report provides a global overview of the current situation of the Goals based on the latest available data on indicators in the global indicator framework.

Introduction

1. In September 2019, Heads of State and Government came together at the Sustainable Development Goals Summit to renew their determination to implement the 2030 Agenda for Sustainable Development. In doing so, they recognized that the first four years of its implementation had included important progress, but that, overall, the world was not on track to deliver its commitments to sustainable development by 2030. In that context, I launched the decade of action and delivery for sustainable development, urging all actors to dramatically increase the pace and scale of implementation efforts.

2. In the present report, the urgency of such efforts is underscored. Drawing on the latest data, it illustrates the continued unevenness of progress and the many areas in which significant improvement is required.¹ Through the end of 2019, progress continued to be made in some areas: global poverty continued to decline, albeit at a slower pace; maternal and child mortality rates were reduced; more people gained access to electricity; and countries were developing national policies to support sustainable development and signing international environmental protection agreements. In other areas, however, progress had either stalled or been reversed: the number of persons suffering from hunger was on the rise, climate change was occurring much more quickly than anticipated and inequality continued to increase within and among countries.

3. Perhaps even more concerning, however, are the impacts and implications of the coronavirus disease (COVID-19) pandemic on all 17 Goals, which are highlighted in the present report. What began as a health crisis has quickly become the worst human and economic crisis in a lifetime. As at the end of April, the coronavirus had spread to more than 200 countries and territories, the number of confirmed cases rose to more than 3.2 million and the global death toll passed 230,000. The effects of the pandemic and the measures taken to mitigate its impact have overwhelmed health systems globally, caused businesses and factories to shut down and had a severe impact on the livelihoods of half of the global workforce, kept 1.6 billion students out of school and disrupted global value chains and the supply of products and are expected to push tens of millions of persons back into extreme poverty and hunger.

4. The poorest and the most vulnerable, including women, children, older persons, persons with disabilities, migrants and refugees and informal sector workers, are being affected disproportionately by the pandemic. Similarly, vulnerable countries, including least developed countries, land-locked developing countries, small island developing States and countries in humanitarian or fragile situations, stand to be hit the hardest in the long term owing to the fragility of their health systems, the limited coverage of their social protection systems, limited financial and other resources, vulnerability to external shocks and excessive dependence on international trade.

5. The global crisis is also affecting critical operations throughout the entire global statistical data system, with delays in planned censuses and surveys and serious disruptions in all statistical operations. National and international statistical organizations will need renewed action and support to ensure the continuity of key statistical compilation activities and the availability of data to inform emergency mitigation actions by governments and all sectors of society to respond to the crisis and continue the implementation of the 2030 Agenda.

¹ The information in the present report is based on the latest available data as at April 2020. The statistical annex and the Global Sustainable Development Goal Indicators Database are available at <https://unstats.un.org/sdgs>.

6. The above-mentioned data underscore the need for international solidarity and cooperation more than ever. The United Nations family is responding across all pillars and all aspects of the crisis. I have called for a large-scale, coordinated and comprehensive multilateral response amounting to at least 10 per cent of global gross domestic product (GDP) and pushed for a series of measures to give developing countries the financial firepower that they need to weather the storm. Furthermore, the United Nations Sustainable Development Group has agreed on a dedicated socioeconomic framework and is mobilizing and repurposing resources to maximize the collective offer of the United Nations to governments at such a critical time.

7. While the crisis is imperilling progress towards the Goals, it also makes their achievement all the more urgent and necessary. It is essential that recent gains be protected as much as possible and that a truly transformative recovery from COVID-19 be pursued, one that reduces the risk of future crises and brings much closer the inclusive and sustainable development required to meet the goals of the 2030 Agenda and the Paris Agreement on climate change, the first task of the decade of action. Those undertakings will require leadership, foresight, innovation, finance and collaboration among all governments and all stakeholders. As the United Nations marks its seventy-fifth anniversary, they will also require a surge in international cooperation and multilateralism.

8. To ensure that the world emerges from the crisis stronger, the United Nations, all governments and all partners have to stay the course together.

Goal 1. End poverty in all its forms everywhere

9. Even before the pandemic, the pace of global poverty reduction was decelerating, and it was projected that the global target of ending poverty by 2030 would be missed. The pandemic is pushing tens of millions of persons back into extreme poverty, undoing years of progress. While the pandemic has highlighted the need to strengthen social protection and emergency preparedness and response, those measures are insufficient to safeguard the poor and the vulnerable, who most need them.

10. After a decline, from 15.7 per cent in 2010 to 10.0 per cent in 2015, the pace of reduction of extreme poverty slowed further, with a nowcast rate of 8.2 per cent in 2019. The pandemic is reversing the trend of poverty reduction. According to the most recent estimates, the global extreme poverty rate is projected to be 8.4 to 8.8 per cent in 2020, which is close to its level in 2017. Consequently, an estimated 40 to 60 million persons will be pushed back into extreme poverty, the first increase in global poverty in more than 20 years.

11. The share of the world's workers living in extreme poverty fell, from 14.3 to 8.3 to 7.1 per cent in 2010, 2015 and 2019, respectively. Progress in that regard was less encouraging for young workers: in 2019, 12.8 per cent of the world's young workers lived in extreme poverty, compared with only 6 per cent of all adult workers. The pandemic is pushing millions of workers into unemployment, underemployment and working poverty.

12. Based on 2016 data, 55 per cent of the world's population, about 4 billion persons, did not benefit from any form of social protection, which is critical to help the poorest and the most vulnerable in the current crisis. At least half of the world's population still lacked full coverage of essential health services, and only 22 per cent of unemployed workers were covered by unemployment benefits.

13. Hurricanes, floods, earthquakes, wildfires and other extreme natural disasters exacerbate poverty. A total of 80 countries reported disaster-related losses for 2018,

including 23,458 deaths and 2,164 persons missing. More than 39 million persons were reported as affected, 29 million of whom saw their livelihood disrupted or destroyed. In terms of direct economic losses, \$23.6 billion was reported by countries, 73 per cent of which was attributed to the agricultural sector.

Goal 2. End hunger, achieve food security and improved nutrition and promote sustainable agriculture

14. The total number of persons suffering from severe food insecurity has been on the rise since 2015, and there are still millions of malnourished children. The economic slowdown and the disruption of food value chains caused by the pandemic are exacerbating hunger and food insecurity. In addition, the upsurge in desert locusts remains alarming in East Africa and Yemen, where 35 million persons already experience acute food insecurity. Owing to the pandemic, some 370 million schoolchildren are missing the free school meals that they rely on. Measures to strengthen food production and distribution systems must be taken immediately to mitigate and minimize the impacts of the pandemic.

15. An estimated 26.4 per cent of the world population, about 2 billion persons, were affected by moderate or severe food insecurity in 2018, an increase from 23.2 per cent in 2014, owing mainly to increases in food insecurity in sub-Saharan Africa and Latin America. Slightly more than 700 million persons, or 9.2 per cent of the world population, experienced severe food insecurity in 2018, implying reductions in the quantity of food consumed to the extent that they possibly experienced hunger.

16. The proportion of children under 5 years of age suffering from chronic undernutrition, as well as stunting (being too short for one's age), decreased, from 23.1 per cent in 2015 to 21.3 per cent in 2019. Globally, 144 million children under 5 years of age were still affected by stunting in 2019. Three quarters of them lived in Central and Southern Asia or sub-Saharan Africa.

17. Globally, 47 million children under 5 years of age, or 6.9 per cent, were affected by acute undernutrition or wasting (low weight for one's height) in 2019 conditions generally caused by limited nutrient intake and infection. More than half of the wasted children lived in Central and Southern Asia. Childhood overweight affected 38 million children under 5 years of age worldwide, or 5.6 per cent, in 2019. Wasting and overweight may coexist at levels considered to be medium to high, the so-called double burden of malnutrition. In Northern Africa and South-Eastern Asia, the rate of wasting was 7.2 per cent and 8.2 per cent, respectively, while the rate of overweight was 11.3 per cent and 7.5 per cent, respectively, in 2019.

18. The share of government expenditure in the agricultural sector, measured by government expenditure in agriculture divided by the sector's share of GDP, fell worldwide, from 0.42 to 0.31 to 0.28 per cent in 2001, 2015 and 2018, respectively. Moreover, aid to agriculture in developing countries fell, from nearly 25 per cent of all donors' sector-allocable aid in the mid-1980s to only 5 per cent, in 2018.

19. In 2019, sharp increases in food prices were concentrated largely in sub-Saharan Africa, driven by production shocks and macroeconomic difficulties. The lingering impact of prolonged conflict and extreme weather conditions in some areas were additional factors.

Goal 3. Ensure healthy lives and promote well-being for all at all ages

20. Progress in many health areas continues, but the rate of improvement has slowed and will not be sufficient to meet most of the Goal 3 targets. The pandemic is devastating health systems globally and threatens health outcomes already achieved. Most countries, in particular poor ones, have insufficient health facilities, medical supplies and health-care workers to meet the surge in demand. Countries need comprehensive health strategies and increased spending on health systems to meet urgent needs and protect health workers, while a global coordinated effort is needed to support countries in need.

Reproductive, maternal, newborn and child health

21. Globally, an estimated 295,000 maternal deaths occurred in 2017, resulting in an overall maternal mortality ratio of 211 maternal deaths per 100,000 live births, a 4 per cent reduction compared with 2015 and a 38 per cent reduction compared with 2000. The majority of the deaths occurred in low- and lower-middle-income countries, and roughly 66 per cent of them occurred in sub-Saharan Africa. At the current pace of progress, the world will fall short of the target of the Goal.

22. Worldwide, 81 per cent of births were assisted by skilled health professionals in the period 2014–2019, up from 64 per cent in the period 2000–2005, with Central Asia, Eastern Asia, Western Asia, Northern America and Europe nearly achieving universal coverage.

23. The concerted effort of the global community continues to reduce preventable child deaths, from a mortality rate of 76 deaths per 1,000 live births in children under 5 years of age in 2000 to 42 in 2015 to 39 in 2018. Notwithstanding the progress, some 5.3 million children died before reaching 5 years of age in 2018 alone, and nearly half of those deaths, or 2.5 million, occurred in the first month of life.

24. Globally, the proportion of women of reproductive age (15 to 49 years) whose family planning needs were met by modern contraceptive methods increased only slightly, from 75.7 per cent in 2010 to around 77 per cent from 2015 to 2020, reaching only 56 per cent in sub-Saharan Africa and 52 per cent in Oceania (excluding Australia and New Zealand).

25. Worldwide, the adolescent birth rate fell steadily, from 45 births per 1,000 women 15 to 19 years of age in 2015 to 41 per 1,000 in 2020, with the highest rate, 101 per 1,000, in sub-Saharan Africa.

Infectious diseases

26. In 2018, there were an estimated 1.7 million new HIV infections, an incidence rate of 0.24 per 1,000 uninfected persons among the total population, almost unchanged from the level of 0.26 per 1,000 in 2015, putting the world off track in achieving the Sustainable Development Goal target. One in three of new HIV infections globally occurred among women 15 to 49 years of age in sub-Saharan Africa.

27. In 2018, an estimated 10 million persons fell ill with tuberculosis (89 per cent were adults, 63 per cent were men and 8.6 per cent were people living with HIV). The incidence of tuberculosis declined, from 141 new and relapse cases per 100,000 persons in 2015 to 132 in 2018. The tuberculosis mortality rate among HIV-negative people fell by 8.3 per cent in the same period. However, large gaps in detection and treatment persist, and the current pace of progress is not fast enough to meet the target of ending the epidemic by 2030. Drug-resistant tuberculosis is also a continuing threat.

28. After many years of impressive reductions in the global malaria burden, progress has stalled. Globally, malaria incidence (the number of cases per 1,000 persons) fell, from 81 in 2000 to 57 in 2014, and remained at a similar level throughout 2018. The world is not on a trajectory to achieve the Sustainable Development Goal target of ending malaria.

29. The use of the hepatitis B vaccine in infants has reduced the incidence of new chronic hepatitis B virus infections considerably. The proportion of children under 5 years of age who became chronically infected fell, from 4.7 per cent in the pre-vaccine era to 0.9 per cent in 2018.

30. In 2018, 1.76 billion persons were reported to have required mass or individual treatment and care for neglected tropical diseases, down from 1.80 billion in 2015 and 2.19 billion in 2010. The 530 million persons requiring treatment and care in least developed countries represented 52 per cent of the population of those countries, down from 78 per cent in 2010. Progress has been driven largely by the fact that at least one neglected tropical disease has been eliminated in 40 countries.

Non-communicable diseases, mental health and environmental risks

31. The probability of dying from cardiovascular disease, cancer, diabetes or chronic respiratory disease at between 30 and 70 years of age decreased, from 19 per cent in 2010 to 18 per cent in 2016, a rate of decline that was insufficient to meet the Sustainable Development Goal target.

32. Based on 2016 data, nearly 800,000 persons died every year by suicide, and 79 per cent of global suicides occurred in low- and middle-income countries.

33. The number of persons dying of tobacco-related illnesses was estimated to be 8.1 million in 2017. The global prevalence of tobacco use among men was 38.6 per cent in 2018, compared with 8.5 per cent among women.

34. In 2016, indoor (household) and outdoor (ambient) air pollution caused some 7 million deaths worldwide. Inadequate water, sanitation and hygiene led to a total of 870,000 deaths in the same year.

Health systems and funding

35. Immunization is one of the world's most successful and cost-effective health interventions. While vaccination coverage among infants increased, from 72 to 85 to 86 per cent in 2000, 2015 and 2018, respectively, an estimated 19.4 million children did not receive essential vaccines in their first year of life. In addition, global coverage levels of the pneumococcal conjugate vaccine, which has the potential to reduce pneumonia significantly, have yet to reach 50 per cent coverage. Measles is a highly contagious disease, and the 69 per cent coverage of the two-dose vaccine in 2018 was insufficient to prevent a measles outbreak.

36. In 2017, only around one third to half of the global population was covered by essential health services. If current trends continue, only 39 to 63 per cent of the global population will be covered by essential health services by 2030.

37. The proportion of the population spending more than 10 per cent of its household budget on out-of-pocket payment for health services increased continuously, from 9.4 to 12.7 per cent (927 million persons), between 2000 and 2015. At current rates, the proportion will reach 12.9 per cent, equal to 1 billion persons, in 2020. Nearly 90 million persons were pushed into extreme poverty owing to out-of-pocket medical expenses.

38. Official development assistance (ODA) for basic health from all donors increased by 41 per cent in real terms since 2010, reaching \$10 billion in 2018. In

2018, about \$1.7 billion was spent on malaria control, \$0.8 billion on tuberculosis control and \$1.9 billion on other infectious diseases, excluding HIV/AIDS.

39. Based on data from the period 2013–2018, globally, women make up more than 76 per cent of medical doctors and nursing personnel combined, but compose only slightly more than 40 per cent of medical doctors and nearly 90 per cent of nursing personnel.

40. In 2019, 166 countries reported the status of their capacity to implement the International Health Regulations with regard to preparedness for detecting, reporting and responding to health emergencies such as COVID-19. Analysis shows that steady progress has been made in nearly every core capacity of the Regulations, except in human resources, compared with 2018.

Goal 4. Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all

41. At the end of 2019, millions of children and young people were still out of school, and more than half of those in school were not meeting minimum proficiency standards in reading and numeracy. The closure of schools to slow the spread of COVID-19 is having an adverse impact on learning outcomes and the social and behavioural development of children and young people. It has affected more than 90 per cent of the world's student population, 1.5 billion children and young people. Although remote learning is provided to many students, children and young people in vulnerable and disadvantaged communities, such as those living in remote areas, extreme poverty, fragile states and refugee camps, do not have the same access thereto. The digital divide will widen existing gaps in equality with regard to education.

42. In 74 countries with comparable data for the 2011–2019 period, around 7 in 10 children 3 and 4 years of age were on track developmentally in at least three of the following domains: literacy-numeracy, physical development, social-emotional development and learning.

43. Participation in organized learning one year before the official primary age of entry grew steadily, from 62 per cent in 2010 to 67 per cent in 2018. However, variation among countries is still wide, with values ranging from 9 to nearly 100 per cent.

44. The primary school completion rate reached 84 per cent in 2018, up from 70 per cent in 2000. Under current trends, the rate is expected to reach 89 per cent globally by 2030. In 2018, 258 million children, adolescents and young people 6 to 17 years of age were still out of school, representing 17 per cent of the global population of that age group. Parity between children or adolescents from the richest and poorest quintiles of the population was achieved in 25 per cent of countries for primary education, 21 per cent of countries for lower secondary education and only 1 per cent of countries for upper secondary education.

45. In 2018, some 773 million adults, two thirds of them women, remained illiterate in terms of reading and writing skills. The global adult literacy rate, for the population 15 years of age and older, was 86 per cent in 2018, while the youth literacy rate, for the population 15 to 24 years of age, was 92 per cent. Southern Asia is home to nearly half of the global illiterate population, and sub-Saharan Africa is home to one quarter thereof.

46. In 2019, less than one half of primary and lower secondary schools in sub-Saharan Africa had access to electricity, the Internet, computers and basic handwashing facilities, key basic services and facilities necessary to ensure a safe and effective learning environment for all students.

47. ODA for scholarships amounted to \$1.6 billion in 2018, up from \$1.3 billion in 2017.

48. Based on data from 129 countries, the percentage of primary school teachers receiving the minimum pedagogical training according to national standards throughout the world has stagnated at 85 per cent since 2015. The percentage is lowest in sub-Saharan Africa (64 per cent) and Southern Asia (72 per cent).

Goal 5. Achieve gender equality and empower all women and girls

49. The commitment to advancing gender equality has brought about improvements in some areas, but the promise of a world in which every woman and girl enjoy full gender equality and all legal, social and economic barriers to their empowerment have been removed remains unfulfilled. The current pandemic is also hitting women and girls hard. Globally, women make up three quarters of medical doctors and nursing personnel. Women already spend three times as many hours as men on unpaid care work at home. The closure of school and day-care centres requires parents, women in particular, to care more for children and facilitate their learning at home. Reports from several countries suggest that domestic violence against women and children is also rising during the global lockdown.

50. In 2019, one in five young women 20 to 24 years of age throughout the world was married in childhood, down from one in four in 2004 and with the highest figure in sub-Saharan Africa, with more than one in three young women.

51. At least 200 million girls and women have been subjected to female genital mutilation, according to recent data from the 31 countries where the practice is concentrated. The harmful practice is becoming less common, but progress is not fast enough to meet the global target of its elimination by 2030.

52. As at 1 January 2020, representation by women in single or lower houses of national parliament reached 24.9 per cent, up slightly from 22.3 per cent in 2015. Women have better access to decision-making positions at the local level, holding 36 per cent of elected seats in local deliberative bodies, based on data from 133 countries and areas.

53. In 2019, 28 per cent of managerial positions in the world were occupied by women, a small increase from 25 per cent in 2000, while women represented 39 per cent of the world's workers and half of the world's working-age population.

54. Based on data from 57 countries for the period 2007–2018, only 55 per cent of married or in-union women 15 to 49 years of age made their own decisions regarding sexual and reproductive health and rights, ranging from less than 40 per cent in Central and Western Africa to nearly 80 per cent in some countries in Europe, South-Eastern Asia and Latin America and the Caribbean.

55. In 2019, in the 75 countries with data, on average, 73 per cent of the laws and regulations needed to guarantee full and equal access to sexual and reproductive health and rights were in place. The findings are particularly encouraging with regard to HIV: on average, countries achieved 87 per cent of enabling laws and regulations for HIV counselling and test services, 91 per cent for HIV treatment and care services and 96 per cent for HIV confidentiality.

56. Empowering women with mobile telephones has been shown to accelerate social and economic development. However, in the 66 countries with data for the 2016–2018 period, the rate of mobile telephone ownership among men was on average 6.8 percentage points higher than the rate among women.

Goal 6. Ensure availability and sustainable management of water and sanitation for all

57. Billions of people throughout the world still lack access to safely managed water and sanitation services and basic handwashing facilities at home, which are critical to preventing spreading the spread of COVID-19. Immediate action to improve Water, Sanitation and Hygiene for All (WASH) is critical to preventing infection and containing its spread.

58. In 2017, only 71 per cent of the global population used safely managed drinking water and just 45 per cent used safely managed sanitation services, leaving 2.2 billion persons without safely managed drinking water, including 785 million without even basic drinking water, and 4.2 billion without safely managed sanitation. Of those, 673 million persons still practised open defecation.

59. In 2016, one in four health-care facilities throughout the world lacked basic water services, and one in five had no sanitation services.

60. In 2017, 3 billion persons lacked soap and water at home. In 2016, 47 per cent of schools worldwide lacked handwashing facilities with available soap and water, and 40 per cent of health-care facilities were not equipped to practise hand hygiene at points of care.

61. Preliminary estimates from 79 mostly high- and higher-middle income countries in 2019 suggest that, in about one quarter of the countries, less than half of all household wastewater flows were treated safely.

62. In 2017, Central and Southern Asia and Northern Africa registered very high water stress – defined as the ratio of fresh water withdrawn to total renewable freshwater resources – of more than 70 per cent, followed by Western Asia and Eastern Asia, with high water stress of 54 per cent and 46 per cent, respectively.

63. In 2018, 60 per cent of 172 countries reported very low, low and medium-low levels of implementation of integrated water resources management and were unlikely to meet the implementation target by 2030.

64. According to data from 67 countries, the average percentage of national transboundary basins covered by an operational arrangement was 59 per cent in the period 2017–2018. Only 17 countries reported that all of their transboundary basins were covered by such arrangements.

65. Globally, in 2018, slightly more than 2.1 per cent of land was covered by freshwater bodies, although unevenly distributed, ranging from 3.5 per cent in developed countries to only 1.4 per cent in developing countries and 1.2 per cent and 1 per cent in least developed countries and small island developing States, respectively. The adverse effects of climate change can decrease the extent of freshwater bodies, thereby worsening ecosystems and livelihoods.

66. ODA disbursements to the water sector increased to \$9 billion, or 6 per cent, in 2018, following a decrease in such disbursements in 2017. However, ODA commitments fell by 9 per cent in 2018. Because countries have signalled a funding gap of 61 per cent between what is needed to achieve national drinking water and sanitation targets and available funding, increasing donor commitments to the water sector will remain crucial to make progress towards Goal 6.

Goal 7. Ensure access to affordable, reliable, sustainable and modern energy for all

67. The world is making good progress on increasing access to electricity and improving energy efficiency. However, millions of people throughout the world still

lack such access, and progress on facilitating access to clean cooking fuels and technologies is too slow. The pandemic has highlighted the need for reliable and affordable electricity in health centres. In addition, a survey conducted in selected developing countries revealed that one quarter of the health facilities surveyed were not electrified, and another quarter had unscheduled outages, affecting their capacity to deliver essential health services. Such deficiencies weaken the health system's response to the current health crisis.

68. The global electrification rate rose, from 83 per cent in 2010 to 90 per cent by 2018. Latin America and the Caribbean and Eastern and South-Eastern Asia maintained strong progress, exceeding 98 per cent access to electricity by 2018. However, the world's deficit was increasingly concentrated in sub-Saharan Africa, where some 548 million persons, or 53 per cent of the population, lacked access to electricity.

69. Access to clean cooking fuels and technologies increased to 63 per cent in 2018, from 60 per cent in 2015 and 56 per cent in 2010. Still, 2.8 billion persons lacked such access and relied primarily on inefficient and polluting cooking systems. Because of the stagnant rate and rapid population growth, in sub-Saharan Africa, the number of people without access to clean fuels for cooking increased.

70. The renewable energy share of total final energy consumption gradually increased, from 16.3 per cent in 2010 to 17.0 per cent in 2015 and 17.3 per cent in 2017. Much faster growth is required to meet long-term climate goals.

71. Global primary energy intensity (the energy used per unit of GDP) improved by 2.2 per cent annually, from 5.2 per cent in 2015 to 5.0 per cent in 2017, but was still short of the 2.7 per cent annual rate needed to reach target 7.3.

72. International financial flows to developing countries in support of clean and renewable energy reached \$21.4 billion in 2017, 13 per cent higher than in 2016 and a twofold increase from flows committed in 2010. Hydropower projects received 46 per cent of 2017 flows, while solar projects received 19 per cent, wind 7 per cent and geothermal 6 per cent.

Goal 8. Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all

73. Even before the current crisis, the global economy was growing at a slower rate than in previous years notwithstanding improvements in labour productivity and unemployment. The pandemic has abruptly and profoundly disrupted it, pushing the world into a recession. The unprecedented shock to the world's labour markets is expected to result in a decrease of around 10.5 per cent in aggregate working hours in the second quarter of 2020, equivalent to 305 million full-time workers. Small and medium enterprises, workers in informal employment, the self-employed, daily wage earners and workers in sectors at the highest risk of disruption have been hit the hardest.

74. In 2018, the rate of growth of global real GDP per capita was 2 per cent. In addition, the rate for least developed countries was 4.5 per cent in 2018, less than the 7 per cent growth rate targeted in the 2030 Agenda. The pandemic is pushing the world into the worst global economic crisis since the Great Depression.

75. After a brief interruption during the global economic downturn of 2008–2009, labour productivity has continued to grow; in 2019, it increased by 1.4 per cent from the previous year.

76. Globally, 61 per cent of workers were in informal employment in 2016. The need to rely on informal employment was more prevalent in sub-Saharan Africa and Central and Southern Asia, where 89 per cent and 86 per cent of workers, respectively, were in such employment. Owing to the unemployment and underemployment caused by the current crisis, some 1.6 billion workers in the informal economy, half of the global workforce, are affected significantly. Globally, the income of informal workers is estimated to fall by 60 per cent in the first months of the crisis.

77. Data on average hourly earnings cast light on income inequality. In a global study conducted by the International Labour Organization, a factor-weighted gender pay gap of 19 per cent in 2017 was revealed.

78. In 2019, the global unemployment rate stood at 5 per cent, with the highest rate, 11 per cent, in Northern Africa and Western Asia. The rate was considerably higher among young workers than for adults in all regions in 2019, with the difference reaching 18 percentage points in Northern Africa and Western Asia, 15 percentage points in Central and Southern Asia and 12 percentage points in Latin America and the Caribbean.

79. In 2019, 22 per cent of the world's young people were not in employment, education or training, a figure that has hardly changed since 2005.

80. In 2018, aid for trade commitments remained stable, at \$58 billion, based on current prices. South and Central Asia received the highest share thereof (31.4 per cent), followed by sub-Saharan Africa (29.2 per cent). Lower-middle-income countries received 37.5 per cent of aid for trade, followed by least developed countries (36.8 per cent).

81. According to data for 2019 from 102 countries, 98 per cent had a youth employment strategy or a plan to develop one in the near future.

Goal 9. Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation

82. Global growth in manufacturing had already steadily declined even before the outbreak. The pandemic is hitting manufacturing industries hard and causing disruptions in global value chains and the supply of products.

83. The air transport sector has been hit the hardest by the pandemic. It is forecasted that airlines will have 1.5 billion fewer international air travellers in 2020 and that international seat capacity could fall by almost three quarters, resulting in a \$273 billion loss, compared with previously expected gross operating revenues.

84. In 2019, manufacturing value added grew only 1.5 per cent since 2018, the slowest year-on-year growth rate since 2012, influenced primarily by tariff and trade tensions affecting all regions. Manufacturing activities are at high risk of disruption during the current crisis, which will have an impact on the sector's employment levels.

85. The share of manufacturing in GDP in least developed countries increased, from 10 per cent in 2010 to 12.4 per cent in 2019, but the growth rate was too slow for the target, doubling the industry's share in GDP by 2030, to be reached.

86. In 2019, 14 per cent of the world's workers were employed in manufacturing activities, a figure that has not changed much since 2000. The share of manufacturing employment was the largest in Eastern and South-Eastern Asia (18 per cent) and the smallest in sub-Saharan Africa (6 per cent).

87. According to surveys covering the period from 2010 to the present, in developing countries, 34 per cent of small-scale industries benefit from loans or lines of credit, which enable them to integrate into local and global value chains. However, only 22 per cent of small-scale industries in sub-Saharan Africa received loans or lines of credit, compared with 48 per cent in Latin America and the Caribbean.

88. After three years of stability, global carbon dioxide emissions from fuel combustion started to rise again in 2017, reaching 32.8 billion tons, underpinned by economic growth and a slowdown in efficiency improvements. However, the intensity of global carbon dioxide emissions has declined by nearly one quarter since 2000, showing a general decoupling of carbon dioxide emissions from GDP growth. The same trend was visible in manufacturing industries after 2010, with global manufacturing intensity falling at an average annual rate of 3 per cent until 2017.

89. Globally, investment in research and development as a proportion of GDP increased, from 1.5 per cent in 2000 to 1.7 per cent in 2015, and remained almost unchanged in 2017, but was only less than 1 per cent in developing regions.

90. The number of researchers per 1 million inhabitants increased, from 1,018 in 2010 to 1,198 in 2017, ranging widely, from 3,707 in Europe and Northern America to only 99 in sub-Saharan Africa. In addition, women represented only 30 per cent of global researchers.

91. Total official flows for economic infrastructure in developing countries reached \$61 billion in 2018, an increase of 32.6 per cent in real terms from 2010. The main sectors assisted were transport (\$22.8 billion) and energy (\$20.3 billion).

92. The share of medium-high and high-technology goods in world manufacturing production reached nearly 45 per cent in 2017. Medium-high and high-technology products continued to dominate manufacturing production in developed regions, reaching 49 per cent in 2017, compared with 9 per cent in least developed countries.

93. Nearly the entire world population lives in an area covered by a mobile network. It is estimated that, in 2019, 96.5 per cent thereof was covered by at least a 2G network, with 81.8 per cent covered by at least a long-term evolution network.

Goal 10. Reduce inequality within and among countries

94. Notwithstanding positive signs of reducing inequality in some dimensions, such as a reduction of relative income inequality in some countries and preferential trade status benefiting lower-income countries, inequality still persists in all forms. The COVID-19 crisis is hitting the poorest and most vulnerable people and countries the hardest and threatens to have a particularly damaging impact on the poorest countries. It is exposing the profound inequalities that exist within and among countries and is exacerbating those inequalities.

95. In 73 of the 90 countries with comparable data during the period 2012–2017, the bottom 40 per cent of the population saw its incomes grow. Moreover, in slightly more than half of those countries, the bottom 40 per cent experienced a growth rate in income that was higher than the overall national average. Still, in all countries with data, the bottom 40 per cent of the population received less than 25 per cent of the overall income or consumption, while the top 10 per cent received at least 20 per cent of the income.

96. Data from 31 countries over the period 2014–2019 show that one in five persons reported having personally experienced discrimination on at least one ground of discrimination prohibited by international human rights law. The pandemic risks exacerbating those patterns.

97. Of the 111 countries with available data as at September 2019, 54 per cent reported having a wide range of policy measures to facilitate the orderly, safe, regular and responsible migration and mobility of people. Central and Southern Asia (80 per cent) and Latin America and the Caribbean (79 per cent) reported having the highest share of countries with such policies, compared with only 33 per cent of the countries in Oceania and Northern Africa and Western Asia.

98. The proportion of products exported by least developed countries, developing regions and small island developing States that could enter international markets free of duty increased, from 66 to 67.4 per cent, 51.1 to 52.1 per cent and 65.4 to 66.5 per cent, respectively, from 2017 to 2018.

99. In 2018, total resource flows for development to developing countries from Development Assistance Committee donors, multilateral agencies and other key providers were \$271 billion, of which \$166 billion were ODA.

Goal 11. Make cities and human settlements inclusive, safe, resilient and sustainable

100. Rapid urbanization has resulted in a growing number of slum dwellers, inadequate and overburdened infrastructure and services and worsening air pollution. The pandemic will hit the hardest the more than 1 billion slum dwellers worldwide, who suffer from a lack of adequate housing, no running water at home, shared toilets, few or no waste management systems, overcrowded public transport and limited access to formal health-care facilities. Many in that population work in the informal sector and are at high risk of losing their livelihood as cities shut down. Urgent response plans are needed to prepare for and respond to outbreaks in informal settlements and slums.

101. The number of slum dwellers reached more than 1 billion in 2018, which represents 24 per cent of the urban population, up slightly from 23 per cent in 2014. The number of people living in urban slums is highest in Eastern and South-Eastern Asia (370 million), sub-Saharan Africa (238 million) and Central and Southern Asia (226 million).

102. Access to adequate, reliable and safe public transport is a basic urban need. As shown in data collected in 2019 from a sample of 610 cities in 95 countries, only half of the world's urban population had convenient access to public transport, defined as living within 500 metres' walking distance from a low-capacity transport system (such as a bus stop) and within 1,000 metres of a high-capacity transport system (such as a railway or a ferry terminal).

103. Data collected in 2019 from a sample of 755 cities in 95 countries show that, in the period 1990–2015, most urban areas recorded a general increase in the extent of built-up area (defined as the presence of buildings) per person. On average, all regions except sub-Saharan Africa and Eastern and South-Eastern Asia recorded a consistent increase in the built-up area per capita, with Australia and New Zealand recording the highest values.

104. Based on 2019 data from 610 cities in 95 countries, the share of land allocated to streets and open spaces, which is critical to cities' productivity and the social and health dimensions of their populations, averaged only about 16 per cent globally. Of those, streets accounted for about three times as much urban land as open public spaces, such as parks and riverfronts. The share of the population that could obtain access to open public spaces within 400 metres' walking distance along a street network averaged 46.7 per cent.

Goal 12. Ensure sustainable consumption and production patterns

105. Worldwide consumption and production, a driving force of the global economy, rely on the use of the natural environment and resources in a model that continues to lead to destructive impacts on the planet. The pandemic offers countries an opportunity to build a recovery plan that will reverse current trends and change consumption and production patterns towards a sustainable future.

106. As at 2019, 79 countries and the European Union reported on at least one national policy instrument that contributed to sustainable consumption and production in their efforts towards the implementation of the 10-Year Framework of Programmes on Sustainable Consumption and Production Patterns.

107. Global domestic material consumption per capita rose by 7 per cent, from 10.8 metric tons per capita in 2010 to 11.7 metric tons in 2017, with increases in all regions except Northern America and Africa. However, domestic material consumption per capita in Europe and Northern America is still 40 per cent higher than the global average, indicating the need to enhance resource efficiency and practices to reduce consumption in the future.

108. The global material footprint rose, from 73.2 billion metric tons in 2010 to 85.9 billion metric tons in 2017, a 17.4 per cent increase since 2010 and a 66.5 per cent increase from 2000. The world's reliance on natural resources continued to accelerate in the past two decades.

109. The Montreal Protocol on Substances that Deplete the Ozone Layer has been universally ratified by 198 parties, and, as a result of its implementation, the overall abundance of ozone-depleting substances in the atmosphere has decreased over the past two decades, with projections to return to 1980 values in the 2030s for northern hemisphere mid-latitude ozone.

110. From 2010 to 2019, global e-waste generation grew continuously, from 5.3 kg per capita to 7.3 kg per capita, while the environmentally sound recycling of e-waste increased at a slower pace, from 0.8 kg per capita to 1.3 kg per capita.

111. Global fossil fuel subsidies amounted to more than \$400 billion in 2018. The continued prevalence of such subsidies, more than double the estimated subsidies for renewables, adversely affects the task of achieving an early peak in global carbon dioxide emissions.

Goal 13. Take urgent action to combat climate change and its impacts

112. The year 2019 was the second warmest on record and the end of the warmest decade, 2010 to 2019. In addition, with a global average temperature of 1.1°C above estimated pre-industrial levels, the global community is far off track to meet either the 1.5 or 2°C targets called for in the Paris Agreement. Although greenhouse gas emissions are projected to drop by 6 per cent in 2020, and air quality has improved as a result of travel bans and the economic slowdown resulting from the pandemic, the improvement is only temporary. Governments and businesses should utilize the lessons learned to accelerate the transitions needed to achieve the Paris Agreement, redefine the relationship with the environment and make systemic shifts and transformational changes to lower greenhouse gas emissions and climate-resilient economies and societies.

113. A total of 85 countries have reported having a national disaster risk reduction strategy aligned with the Sendai Framework for Disaster Risk Reduction 2015–2030

to some extent since its adoption in 2015. In 2018, 55 countries reported that at least some of their local governments had a local disaster risk reduction strategy aimed at contributing to sustainable development and strengthening socioeconomic health and environmental resilience by focusing on poverty eradication, urban resilience and climate change adaptation.

114. As at 31 March 2020, 186 parties (185 countries plus the European Union) had communicated their first nationally determined contribution, and several parties had communicated their second or updated nationally determined contribution to the United Nations Framework Convention on Climate Change. Parties have been requested to update existing nationally determined contributions or communicate new ones by 2020, providing a valuable opportunity for parties to increase their level of ambition in climate action.

115. In 2019, at least 120 of 153 developing countries had undertaken activities to formulate and implement national adaptation plans, an increase of 29 countries, compared with 2018. The plans will help countries achieve the global goal on adaptation under the Paris Agreement.

116. With regard to global climate finance, there was an increase of \$584 billion, or 17 per cent, from 2013 to 2014 and of \$681 billion from 2015 to 2016. High levels of new private investment in renewable energy account for the spurt in growth and represent the largest segment of the global total. While these financial flows are considerable, they are relatively small in relation to the scale of annual investment needed for a low-carbon, climate-resilient transition. Moreover, investments in climate activities tracked across sectors were still surpassed by those related to fossil fuels in the energy sector alone (\$781 billion in 2016).

Goal 14. Conserve and sustainably use the oceans, seas and marine resources for sustainable development

117. Oceans and fisheries continued to support the global population's economic, social and environmental needs while suffering unsustainable depletion, environmental deterioration and carbon dioxide saturation and acidification. Current efforts to protect key marine environments and small-scale fishers and invest in ocean science are not yet meeting the urgent need to protect this vast, fragile resource.

118. The ocean absorbs around 23 per cent of the annual emissions of anthropogenic carbon dioxide to the atmosphere, helping to alleviate the impacts of climate change on the planet, however, resulting in a decreasing pH and acidification of the ocean. A new ocean acidification data portal shows an increase in variability in pH and the acidity of the oceans by 10 to 30 per cent in the period 2015–2019.

119. The sustainability of global fishery resources continues to decline, though at a reduced rate, with the proportion of fish stocks within biologically sustainable levels at 65.8 per cent in 2017, down from 90 per cent in 1974 and 0.8 percentage point lower than 2015 levels.

120. As at December 2019, more than 24 million km², or 17 per cent, of waters under national jurisdiction (up to 200 nautical miles from shore) were covered by protected areas, more than doubling in extent since 2010. Much of the coverage is concentrated in Oceania and Latin America and the Caribbean.

121. As at February 2020, the number of parties to the Agreement on Port State Measures to Prevent, Deter and Eliminate Illegal, Unreported and Unregulated Fishing – the first binding international agreement that specifically targets illegal, unreported and unregulated fishing – increased to 66 (including the European Union)

from 58 in the previous year, and nearly 70 per cent of countries reported scoring high on the implementation thereof.

122. The contribution of sustainable marine capture fisheries remained stable at the global level, with regional variation, representing the largest contribution to the GDP in Pacific small island developing States and least developed countries, averaging 1.55 and 1.15 per cent, respectively, in 2011 to 2017.

Goal 15. Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss

123. Forest areas continued to decline, protected areas were not concentrated in areas of key biodiversity and species remained threatened with extinction. However, Efforts were gaining traction and having positive effects that could help to reverse those outcomes, such as increased progress towards sustainable forest management; gains in protected area coverage for terrestrial, freshwater and mountain areas; and progress in implementing programmes, legislation and accounting principles to protect biodiversity and ecosystems.

124. The proportion of forest area fell, from 31.9 per cent of total land area in 2000 to 31.2 per cent in 2020, representing a net loss of nearly 100 million ha of the world's forests. From 2000 to 2020, forest area increased in Asia, Europe and Northern America, while significantly decreasing in Latin America, sub-Saharan Africa and South-Eastern Asia, driven by land conversion to agriculture. Notwithstanding the overall loss, 2017 data showed that the proportion of forests in protected areas and under long-term management plans, as well as certified forest area, increased or remained stable at the global level and in most regions of the world.

125. In 2020, the average proportion of each key biodiversity area for terrestrial, freshwater and mountain biodiversity within protected areas was 44, 41 and 41 per cent, respectively, an increase of around 12 to 13 percentage points since 2000. However, most key biodiversity areas still have incomplete or no coverage by protected areas.

126. As at 2019, 123 countries had committed themselves to setting their voluntary targets for achieving land degradation neutrality, and in 60 countries, governments had already officially endorsed those targets.

127. Species extinction, which threatens sustainable development and compromises global heritage, is driven primarily through habitat loss from unsustainable agriculture, harvest and trade; deforestation; and invasive alien species. Globally, the species extinction risk has worsened by about 10 per cent over the past three decades, with the Red List Index (which measures the risk of extinction, whereby a value of 1 indicates no threat of extinction and a value of 0 indicates that all species are extinct) declining, from 0.82 in 1990 to 0.75 in 2015 to 0.73 in 2020.

128. As at 1 February 2020, 122 countries and the European Union had ratified the Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization to the Convention on Biological Diversity (an increase of 53 from 2019), and 63 countries and the European Union had shared information on their access and benefit-sharing frameworks. Regarding the International Treaty on Plant Genetic Resources for Food and Agriculture, there are now 146 contracting parties thereto, and 56 countries have provided information about their access and benefit-sharing measures.

129. Only about a third of reporting parties are on track to achieving their national biodiversity targets as reported in national reports under the Convention on Biological Diversity. As at January 2020, 129 parties, including the European Union, had reported their sixth national report, and 113 parties had assessed progress towards their national targets related to Aichi Biodiversity Target 2. About half the parties had made progress towards their targets, but not at a rate that will allow them to meet their goals.

Goal 16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels

130. Conflict, insecurity, weak institutions and limited access to justice remain a great threat to sustainable development. Millions of people have been deprived of their security, human rights and access to justice. In 2018, the number of people fleeing war, persecution and conflict exceeded 70 million, the highest level recorded by the Office of the United Nations High Commissioner for Refugees in nearly 70 years. The pandemic is potentially leading to an increase in social unrest and violence, which would greatly undermine the world's ability to meet the targets of Goal 16.

131. The global rate of homicide per 100,000 persons slowly declined, from 6.8 to 5.9 to 5.8 per cent in 2000, 2015 and 2018, respectively, corresponding to approximately 440,000 victims of homicide, 81 per cent of whom were men and 19 per cent of whom were women. Latin America and the Caribbean (33 per cent) and sub-Saharan Africa (36 per cent) accounted for more than two thirds of homicide victims globally.

132. Violent forms of discipline targeted towards children were widespread. In 69 countries (mostly low- and middle-income ones) with available data from 2012 to 2019, nearly 8 in 10 children 1 to 14 years of age were subjected to some form of psychological aggression and/or physical punishment at home in the previous month.

133. Sexual violence is one of the most unsettling violations of children's rights. In slightly more than one in four countries with comparable data from 2012 to 2019 (45 countries), at least 5 per cent of women between 18 and 29 years of age reported experiencing sexual violence in childhood.

134. Data from 2016 to 2018 show that the proportion of prisoners held in detention without being sentenced for a crime is 31 per cent, the same level as in 2005. Significant increases over the past three years were recorded in Asia and Oceania.

135. Data from 38 countries over the past decade suggest that high-income countries have the lowest prevalence of bribery (an average of 3.7 per cent), while lower-income countries bear the heaviest bribery burden when accessing public services (22.3 per cent).

136. Through the implementation of birth registration with proof of legal identity, children's rights can be protected and universal access to justice and social services can be enabled. However, based on data from 2010 to 2019, the births of around one in four children under 5 years of age were never officially recorded. Fewer than half (44 per cent) of all children in sub-Saharan Africa under 5 years of age had their births registered.

137. In 2019, the United Nations tracked 357 killings (a decrease from 476 in 2018) and 30 enforced disappearances of human rights defenders, journalists and trade unionists in 47 countries.

138. The number of countries with binding laws and policies giving individuals a right to obtain access to information held by public authorities (the right to information) has continued to rise, reaching 127 in 2019. At least 43 countries have adopted such guarantees in the past 10 years, 40 per cent of them in Africa.

139. In 2019, 40 per cent of countries had a national human rights institution that had successfully achieved compliance with the principles relating to the status of national institutions for the promotion and protection of human rights (the Paris Principles). Access to internationally recognized national human rights institutions, however, remains overdue in 78 countries, in particular in Eastern and South-Eastern Asia, Latin America and the Caribbean, Oceania and sub-Saharan Africa.

Goal 17. Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

140. Strengthening global partnerships and enhancing the means of implementing the Goals have remained a challenge owing to scarce financial resources, trade tensions, technological obstacles and a lack of data. The pandemic is adding hardships to the implementation of the Goals. As COVID-19 continues to spread, global financial markets have experienced great losses and intense volatility, and more than \$100 billion in capital has flowed out of emerging markets since the outbreak, the largest outflow ever recorded. World trade is expected to plunge by between 13 and 32 per cent in 2020. Strengthening multilateralism and global partnerships is more important than ever before. The global nature of the pandemic requires the participation of all governments, the private sector, civil society organizations and people throughout the world.

Finance

141. Net ODA flows totalled \$147 billion in 2019, nearly the same level as in 2018, but with an increased share going to the neediest countries. Bilateral ODA to least developed countries rose by 3 per cent in real terms since 2018, with aid to Africa rising by 1 per cent, but humanitarian aid fell by 3 per cent.

142. Global foreign direct investment (FDI) flows continued to slide, falling by 13 per cent, from a revised \$1.5 trillion in 2017 to \$1.3 trillion in 2018. The decline, the third consecutive annual decrease in FDI, was mainly a result of large repatriations of accumulated foreign earnings by multinational enterprises following tax reforms introduced at the end of 2017. It is projected that the pandemic may cause global FDI to shrink by 30 to 40 per cent in the period 2020–2022.

143. Remittance flows to lower-middle-income countries are estimated to have reached \$554 billion in 2019, exceeding official aid by a factor of three since the mid-1990s. In 2019, remittances overtook FDI flows to lower-middle-income countries, according to estimates. However, growth in remittance flows slowed to 4.7 per cent in 2019, compared with a robust 8.6 per cent in 2018. Global remittances are projected to fall to \$445 billion, or by 20 per cent, in 2020 owing to the pandemic.

144. Globally, government revenue accounted for approximately 30 per cent of GDP in 2018, remaining stable compared with previous years, but with wide variation among countries. The average overall tax burden (revenue in the form of taxes) was 25 per cent of GDP among advanced economies and 17 per cent of GDP among emerging markets and developing economies. The overall average of the proportion of government expenditure funded by taxes was about 65 per cent among advanced economies and 60 per cent among emerging market economies.

Information and communications technology

145. More than half of the world's population is now online. At the end of 2019, 53.6 per cent of individuals, or 4.1 billion persons, were using the Internet, ranging from only 20 per cent in Oceania (excluding Australia and New Zealand) and 26 per cent in sub-Saharan Africa to 84 per cent in Europe and Northern America and 87 per cent in Australia and New Zealand.

146. Fixed broadband subscriptions are increasing continuously. Globally, there were nearly 15 fixed broadband subscriptions for every 100 inhabitants in 2019, ranging from 33.6 in developed countries to only 11.2 in developing countries. In least developed countries, owing to the high cost and lack of infrastructure, there were nearly no fixed broadband connections. From a health, economic and social perspective, this digital divide is costing developing countries and their peoples dearly during the pandemic.

Capacity-building

147. Total ODA for capacity-building and national planning stood at \$33.5 billion in 2017, representing 14 per cent of total sector allocable aid, stable since 2010. The main sectors assisted were public administration, energy and finance, which received a total of \$13.0 billion.

Trade

148. Trade-weighted tariffs worldwide declined, from 2.2 per cent in 2017 to an average of 2.1 per cent in 2018.

149. The share of exports of least developed countries in global merchandise trade remained marginal, at just over 1 per cent in 2018. Growth in global exports of least developed countries stagnated over the past decade, missing the target of doubling the share of global exports of least developed countries by 2020 from 2011. In 2018, least developed countries recorded significant year-on-year growth in services exports, reaching a global share of 0.8 per cent. The share of global services exports of developing regions has flattened in past years, amounting to a share of 30 per cent at the end of 2018.

Data, monitoring and accountability

150. In 2019, 132 countries reported having national statistical legislation that was compliant with the Fundamental Principles of Official Statistics, up from 111 countries in 2018.

151. In 2019, 141 countries reported having implemented a national statistical plan, up from 129 countries in 2018. Although it had the second highest number of countries (36) implementing national statistical plans, sub-Saharan Africa had the lowest percentage of fully funded plans, with only 25 per cent of plans fully funded, compared with 95 per cent in Northern America and Europe.

152. In 2017, countries received \$689 million in support from multilateral and bilateral donors for all areas of statistics, up from \$623 million in 2016. However, that amount accounted for only 0.34 per cent of total ODA. International funding for data and statistics was at only around half the level at which it needed to be.

153. In the period 2014–2018, 147 countries had birth registration data that were at least 90 per cent complete, and 153 countries had death registration data that were at least 75 per cent complete. In sub-Saharan Africa, 28 of 53 countries had birth registration data, and only 23 of 53 countries had death registration data.
